

Beacon Product Builder

Overview

Beacon is Swym's merchant intelligence layer that converts shopping intent into actionable insights. This exercise evaluates your ability to uncover merchant friction, build working intelligence tools, and reason through product architecture and defensibility.

Part 1: Build

1. **Objective:** Select any online store and ship a working tool or script that delivers a clear, actionable insight using public data. Identify key friction points across the shopper journey.
2. **Deliverable:** Provide functional, executable output (runnable code, script output, or working video demo). Static decks or unexecuted specifications are not accepted.
3. **AI Tooling:** Use any AI assistance desired, but include your prompts and workflow transcript.

Part 2: Thought Process & Architecture

4. **From Question to Answer:** Detail how you would answer a merchant's natural language query (e.g., "Which products should I restock first?") using intent data. Identify potential failure modes and safeguards required before launching to 50,000 stores.
5. **Product Defensibility:** Evaluate whether AI merchant intelligence is a defensible standalone product or a feature that platform owners (e.g., Shopify) will inevitably absorb.

Part 3: Product Thinking & Process

6. **Product Discovery & Prioritization:** Briefly outline your framework for identifying high-value merchant problems and deciding which features to prioritize for Beacon.
7. **AI Transcript / Reflection:** Include a link to your AI interaction transcript or a short reflection detailing how you leveraged AI tools throughout your workflow.

Next Steps

We will review your submission and discuss your approach during a 45-minute follow-up session. Please leave any questions directly as comments in this document.
